

Installation Guide: Whisker Set Plugs

Overview

Whisker Set Plugs are used with the Safety Anchor Post System (SAPS) to protect anchor assemblies from concrete ingress during pouring operations.

Correct Usage Procedure

- 1. Preparation:** Before the concrete pour, verify the anchor (e.g., Dualie Anchor) is positioned and secured as per structural plans.
- 2. Installation:** Firmly seat the Whisker Set Plug into the top of the anchor assembly.
- 3. Verification:** Ensure the plug creates a complete seal to prevent concrete slurry from entering internal threads or attachment points during pouring and vibration.
- 4. Post-Pour:** After the concrete has cured, carefully remove the plug to reveal a clean, debris-free attachment point.

Best Practices

- Maintain accessibility to plugs during the pour process.
- Ensure the seal is not disturbed by concrete placement equipment or vibration tools.
- Do not reuse damaged plugs.

Critical Note: Always reference the official project-specific technical data provided by the manufacturer (SAPS) regarding slab depth and environmental conditions.
